

# TURNING PRODUCT INNOVATIONS INTO PRACTICE SUCCESS >>>

## How advancements in restorative products create opportunities for faster, more effective patient care.

Ordering restorative care products – like any other administrative task – can become a repetitious habit. In some ways, it's a good thing. You always get what you know works well. But what if there's a better way to do the same procedures you've been performing for years?

As it turns out, there probably is a better way. Manufacturers are constantly developing new restorative technology to cut down on the time patients spend in your chair. These tools and products are proven to offer the same, or an increased level of care. So, why do practices shy away from using new, or "new to them" products? Sometimes, it's a matter of awareness.

LET'S TAKE A LOOK AT THE POSSIBILITIES. >>>

  
PATTERSON®  
DENTAL

## CURING LIGHTS

LED curing lights are now the standard of care in operatories across the country. However, the latest advancements put even more convenience and efficacy into the hands of dentists and assistants. Now, with lightweight, cordless LED curing lights, staff are able to cure at any angle with decreased hand and forearm stress. Plus, better LED technology now cures all materials (composites, bonding agents, etc.) at deeper depth – instead of curing a restoration in 2 mm increments, new technology updates allow you to cure the full restoration at once.

## COMPOSITES AND BLOCKS

Often, the chief concern for patients undergoing a restorative procedure is esthetics. As such, it probably wouldn't surprise you to learn that there's been a great deal of innovation around the composites and ceramic blocks used to craft true-to-life tooth contour. Due to new particle sizes, composites have become stronger, and more esthetically pleasing. In the same way, blocks have been formulated to create more detailed restorations than ever before.

Composites are now offered in a variety of shades, eliminating the need for extra time spent on color-match. What's more, today's composites are formulated for use across all cavity classes.

## BONDING AGENTS

The faster you can create a strong bond, the more patients you can treat. It's a simple thought, but with so many steps in the bonding process – etching, rinsing, priming, bonding, and light curing – manufacturers and dental professionals alike recognized it was time for a change. These days, newer products are an all-in-one solution, complete with a self-etching formula that bonds to a variety of direct and indirect. It's easier and faster, which makes everyone happy.

## IMPRESSION MATERIAL

Impressions have historically been messy business, with runny delivery forms that created a lack of comfort for patients. Updated dispensers have eliminated hand-mixing your impression material as well – now, it mixes inside the cartridge or machine, and is immediately ready to be dispensed into the tray.

## THE PATTERSON PROMISE

As your trusted partner for restorative products, Patterson is committed to connecting you with the best possible solutions for your practice. With an expansive selection of top restorative products – from curing lights to composites and everything in between – it's easier than ever to deliver the positive patient care experience that you want for every person who walks in your door.
